microfluidic chip
environmental or biomedical purpose
>100 microns

Design strategy to prevent clogging when size > 100 microns
- spiral inertial focus
- serpentine inertial focus

ideas:

* ~~food~~ - particle seperation → found in plants (cellulose)
- can a spiral inertial microfluidic chip seperate food particles >100 mm based on particle size?
- use food-grade particles with controlled sizes
  - → 100-200 mm cellulose particles / fibers
  - → 350-500 mm cellulose particles / fibers

use sieving to separate?
300 micron sieve
→ if can't find controlled sizes

Outlets (212, 300, 500, 710, 850 mm)

Cellets MCC spheres has spherical microcrystalline cellulose (MCC) particle in controlled size ranges.
→ need to request for academic purposes, don't just sell commercially?
